### **Executive Summary**

#### Summary of methodologies

Data Collection via API, Web Scraping

Exploratory Data Analysis (EDA) with Data Visualization

EDA with SQL

Interactive Map with Folium

Dashboards with Plotly Dash

**Predictive Analysis** 

#### Summary of all results

**Exploratory Data Analysis results** 

Interactive maps and dashboard

Predictive results

### Introduction

#### Project background and context

The goal of this project is to predict whether the first stage of Space X's Falcon 9 rocket can land again after launch. If landing the first stage of the rocket is possible then Space X's solution will be the most cost-effective and competitive of all the solutions to date.

#### Problems you want to find answers

What are the main characteristics of a successful or failed landing?

What are the effects of each relationship of the rocket variables on the success or failure of a landing?

What are the conditions which will allow to achieve the best landing success rate?

# Methodology

#### **Executive Summary**

- Data collection methodology:
  - SpaceX REST API
  - Web Scrapping from Wikipedia
- Perform data wrangling
  - Dropping unnecessary columns
  - One Hot Encoding for classification models
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - How to build, tune, evaluate classification models

### **Data Collection**

Datasets are collected from Rest SpaceX API and webscrapping Wikipedia

- The information obtained by the API are rocket, launches, payloadinformation.
- The Space XREST API URL is api.spacexdata.com/v4/

- The information obtained by the webscrapping of Wikipedia are launches, landing, payloadinformation.
- URL is https://en.wikipedia.org/w/index.php?title=List\_of\_Falcon\_9\_and\_Falcon\_Heavy\_launches&oldid=102 7686922

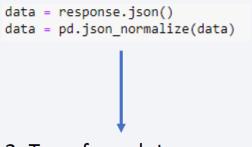

# Data Collection - SpaceX API

#### 1. Getting Response from API

spacex\_url="https://api.spacexdata.com/v4/launches/past"
response = requests.get(spacex\_url)

#### 2. Convert Response to JSON File

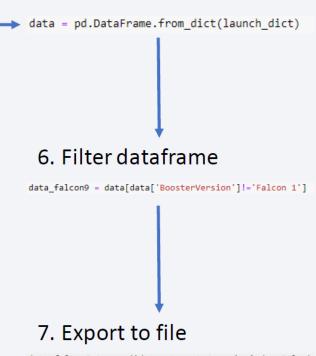

#### 3. Transform data

getLaunchSite(data)
getPayloadData(data)
getCoreData(data)
getBoosterVersion(data)

#### 4. Create dictionary with data

#### 5. Create dataframe

data\_falcon9.to\_csv('dataset\_part\_1.csv', index=False)

# **Data Collection - Scraping**

### 1. Getting Response from HTML response = requests.get(static url) 2. Create BeautifulSoup Object soup = BeautifulSoup(response.text, "html5lib") 3. Find all tables html\_tables = soup.findAll('table') 4. Get column names for th in first\_launch\_table.find\_all('th'): name = extract column from header(th) if name is not None and len(name) > 0 :

column\_names.append(name)

```
5. Create dictionary
```

```
launch dict= dict.fromkeys(column names)
# Remove an irrelvant column
del launch dict['Date and time ( )']
# Let's initial the launch_dict with each value to be an empty list
launch_dict['Flight No.'] = []
launch_dict['Launch site'] = []
launch dict['Payload'] = []
launch_dict['Payload mass'] = []
launch_dict['Orbit'] = []
launch_dict['Customer'] = []
launch_dict['Launch outcome'] = []
# Added some new columns
launch dict['Version Booster']=[]
launch dict['Booster landing']=[]
launch dict['Date']=[]
launch_dict['Time']=[]
```

#### 6. Add data to keys

```
extracted row = 0
      #Extract each table
      for table number, table in enumerate(soup.find all
         # get table row
          for rows in table.find_all("tr"):
             #check to see if first table heading is a.
             if rows.th:
                 if rows.th.string:
                     flight number=rows.th.string.stri
                     flag=flight number.isdigit()
        See notebook for the rest of code
7. Create dataframe from dictionary
      df=pd.DataFrame(launch dict)
     8. Export to file
```

df.to\_csv('spacex\_web\_scraped.csv', index=False)

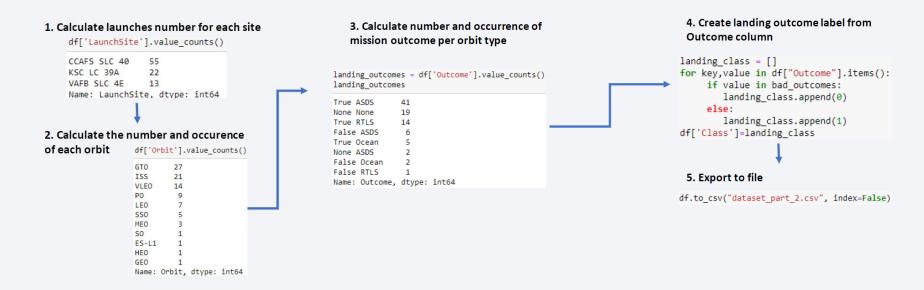

# **Data Wrangling**

In the dataset, there are several cases where the booster did not land successfully.

True Ocean, True RTLS, True ASDS means the mission has been successful.

False Ocean, False RTLS, False ASDS means the mission was a failure.

We need to transformstring variables into categorical variables where 1 means the mission has been successful and 0 means the mission was a failure.

### **EDA** with Data Visualization

#### Scatter Graphs

- Flight Number vs. Payload Mass
- Flight Number vs. Launch Site
- Payload vs. Launch Site
- Orbit vs. Flight Number
- Payload vs. Orbit Type
- Orbit vs. Payload Mass

Scatter plots show relationship between variables. This relationship is called the correlation.

#### Bar Graph

Success rate vs. Orbit

Bar graphs show the relationship between numeric and categoric variables.

### Line Graph

Success rate vs. Year

Line graphs show data variables and their trends. Line graphs can help to show global behavior and make prediction for unseen data.

### **EDA** with SQL

We performed SQL queries to gather and understand data from dataset:

Displaying the names of the unique lauunch sites in the space mission.

Display 5 records where launch sites begin with the string 'CCA'

Display the total payload mass carried by boosters launched by NASA (CRS).

Display average payload mass carried by booster version F9 v1.1.

List the date when the first successful landing outcome in ground pad was achieved.

List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000.

List the total number of successful and failure mission outcomes.

List the names of the booster\_versions which have carried the maximum payload mass.

List the records which will display the month names, failure landing\_outcomes in drone ship, booster versions,

launch\_site for the

months in year 2015.

Rank the count of successful landing\_outcomes between the date 04 06 2010 and 20 03 2017 in descending order.

### Build an Interactive Map with Folium

- Folium map object is a map centered on NASA Johnson Space Center at Houson, Texas Red circle at NASA Johnson Space Center's coordinate with label showing its name(folium.Circle, folium.map.Marker).
  - Red circles at each launch site coordinates with label showing launch site name (folium.Circle, folium.map.Marker, folium.features.Divlcon).
  - The grouping of points in a cluster to display multiple and different information for the same coordinates (folium.plugins.MarkerCluster).
  - Markers to show successful and unsuccessful landings. Green for successful landing and Red for unsuccessful landing. (folium.map.Marker, folium.lcon).
  - Markers to show distance between launch site to key locations (railway, highway, coastway, city) and plot a line between them. (folium.map.Marker, folium.PolyLine, folium.features.Divlcon)
- These objects are created in order to understand better the problem and the data. We can show
  easily all launch sites, their surroundings and the number of successful and unsuccessful
  landings.

### Build a Dashboard with Plotly Dash

Dashboard has dropdown, pie chart, rangeslider and scatter plot components
 Dropdown allows a user to choose the launch site or all launch sites (dash\_core\_components.Dropdown).

 Pie chart shows the total success and the total failure for the launch site chosen with the dropdown component (plotly.express.pie).

Range slider allows a user to select a payload mass in a fixed range (dash\_core\_components.RangeSlider). Scatter chart shows the relationship between two variables, in particular Success vs Payload Mass (plotly.express.scatter).

# Predictive Analysis (Classification)

#### Data preparation

Load dataset
Normalize data

Split data into training and test sets.

#### Model preparation

Selection of machine learning algorithms
Set parameters for each algorithm to GridSearchCV
Training GridSearchModel models with training dataset

#### Model evaluation

Get best hyperparameters for each type of model Compute accuracy for each model with test dataset Plot Confusion Matrix

#### Model comparison

Comparison of models according to their accuracy

The model with the best accuracy will be chosen (see Notebook for result)

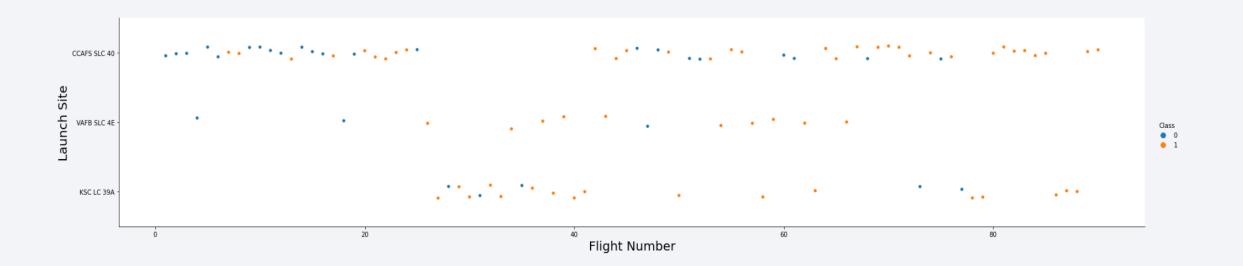

### Results

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

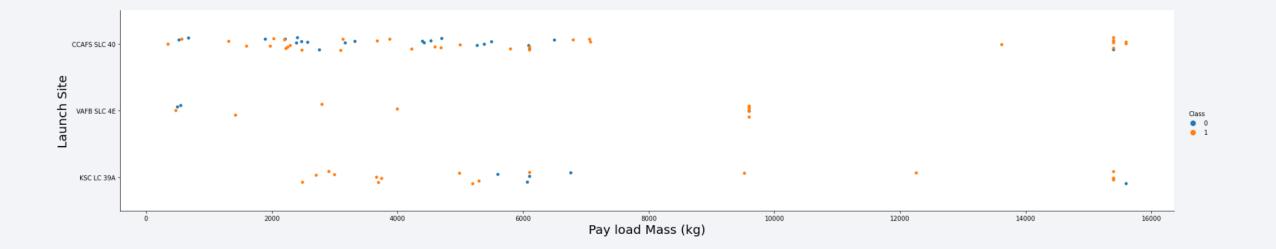

# Flight Number vs. Launch Site

We observe that, for each site, the success rate is increasing.

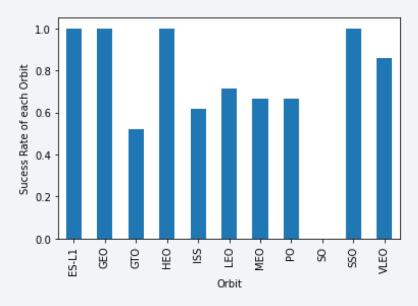

# Payload vs. Launch Site

Depending on the launch site, a heavier payload may be a consideration for a successful landing. On the other hand, a too heavy payload can make a landing fail.

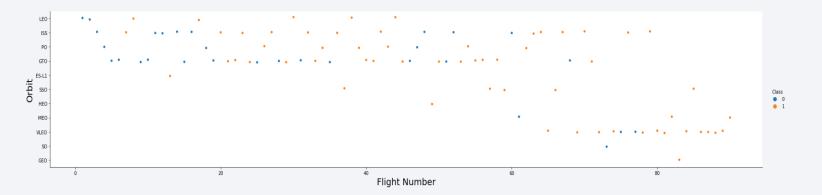

# Success Rate vs. Orbit Type

With this plot, we can see success rate for different orbit types. We note that ES-L1, GEO, HEO, SSO have the best success rate.

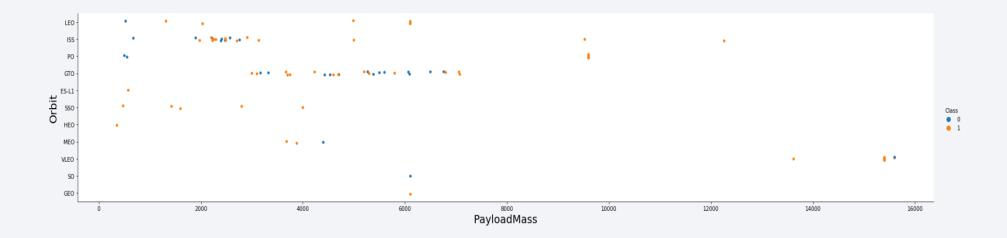

# Flight Number vs. Orbit Type

We notice that the success rate increases with the number of flights for the LEO orbit. For some orbits like GTO, there is no relation between the success rate and the number of flights. But we can suppose that the high success rate of some orbits like SSO or HEO is due to the knowledge learned during former launches for other orbits.

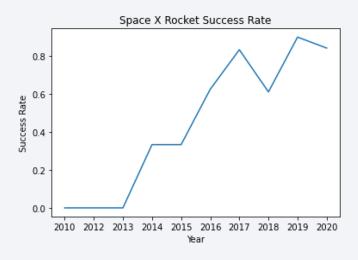

# Payload vs. Orbit Type

The weight of the payloads can have a great influence on the success rate of the launches in certain orbits. For example, heavier payloads improve the success rate for the LEO orbit. Another finding is that decreasing the payload weight for a GTO orbit improves the success of a launch.

# Launch Success Yearly Trend

Since 2013, we can see an increase in the Space X Rocket success rate.

### All Launch Site Names

SELECT DISTINCT "LAUNCH\_SITE" FROM SPACEXTBL

Launch\_Site

CCAFS LC-40

VAFB SLC-4E

KSC LC-39A

CCAFS SLC-40

The use of DISTINCT in the query allows to remove duplicate LAUNCH\_SITE.

# Launch Site Names Begin with 'CCA'

SELECT \* FROM SPACEXTBL WHERE "LAUNCH\_SITE" LIKE '%CCA%' LIMIT 5

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Orbit	Customer
04- 06- 2010	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX
08- 12- 2010	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO
22- 05- 2012	07:44:00	F9 v1.0 B0005	CCAFS LC- 40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)
08- 10- 2012	00:35:00	F9 v1.0 B0006	CCAFS LC- 40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)
01- 03- 2013	15:10:00	F9 v1.0 B0007	CCAFS LC- 40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)

# **Total Payload Mass**

```
SELECT SUM("PAYLOAD_MASS__KG_") FROM SPACEXTBL WHERE "CUSTOMER" = 'NASA (CRS)'

SUM("PAYLOAD_MASS__KG_")

45596
```

This query returns the sum of all payload masses where the customer is NASA (CRS).

# Average Payload Mass by F9 v1.1

```
SELECT AVG("PAYLOAD_MASS__KG_") FROM SPACEXTBL WHERE "BOOSTER_VERSION" LIKE '%F9 v1.1%'
```

AVG("PAYLOAD\_MASS\_\_KG\_")

2534.6666666666665

### First Successful Ground Landing Date

```
SELECT MIN("DATE") FROM SPACEXTBL WHERE "Landing _Outcome" LIKE '%Success%'

MIN("DATE")

01-05-2017
```

With this query, we select the oldest successful landing.

The WHERE clause filters dataset in order to keep only records where landing was successful. With the MIN function, we select the record with the oldest date.

### Successful Drone Ship Landing with Payload between 4000 and 6000

```
%sql SELECT "BOOSTER_VERSION" FROM SPACEXTBL WHERE "LANDING _OUTCOME" = 'Success (drone ship)' \
AND "PAYLOAD_MASS__KG_" > 4000 AND "PAYLOAD_MASS__KG_" < 6000;

Booster_Version
    F9 FT B1022
    F9 FT B1026
    F9 FT B1021.2
    F9 FT B1031.2</pre>
```

This query returns the booster version where landing was successful and payload mass is between 4000 and 6000 kg. The WHERE and AND clauses filter the dataset.

#### Total Number of Successful and Failure Mission Outcomes

```
%sql SELECT (SELECT COUNT("MISSION_OUTCOME") FROM SPACEXTBL WHERE "MISSION_OUTCOME" LIKE '%Success%') AS SUCCESS, \
(SELECT COUNT("MISSION_OUTCOME") FROM SPACEXTBL WHERE "MISSION_OUTCOME" LIKE '%Failure%') AS FAILURE

SUCCESS FAILURE

100 1
```

With the first SELECT, we show the subqueries that return results. The first subquery counts the successful mission. The second subquery counts the unsuccessful mission. The WHERE clause followed by LIKE clause filters mission outcome. The COUNT function counts records filtered.

### **Boosters Carried Maximum Payload**

```
%sql SELECT DISTINCT "BOOSTER_VERSION" FROM SPACEXTBL \
WHERE "PAYLOAD MASS KG " = (SELECT max("PAYLOAD MASS KG ") FROM SPACEXTBL)
```

#### Booster\_Version

F9 B5 B1048.4

F9 B5 B1049.4

F9 B5 B1051.3

F9 B5 B1056.4

F9 B5 B1048.5

F9 B5 B1051.4

F9 B5 B1049.5

F9 B5 B1060.2

F9 B5 B1058.3

F9 B5 B1051.6

F9 B5 B1060.3

F9 B5 B1049.7

We used a subquery to filter data by returning only the heaviest payload mass with MAX function. The main query uses subquery results and returns unique booster version (SELECT DISTINCT) with the heaviest payload mass.

### 2015 Launch Records

```
%sql SELECT substr("DATE", 4, 2) AS MONTH, "BOOSTER_VERSION", "LAUNCH_SITE" FROM SPACEXTBL\
WHERE "LANDING _OUTCOME" = 'Failure (drone ship)' and substr("DATE",7,4) = '2015'

MONTH Booster_Version Launch_Site

01    F9 v1.1 B1012    CCAFS LC-40

04    F9 v1.1 B1015    CCAFS LC-40
```

This query returns month, booster version, launch site where landing was unsuccessful and landing date took place in 2015. Substr function process date in order to take month or year. Substr(DATE, 4, 2) shows month. Substr(DATE, 7, 4) shows year.

### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
%sql SELECT "LANDING _OUTCOME", COUNT("LANDING _OUTCOME") FROM SPACEXTBL\
WHERE "DATE" >= '04-06-2010' and "DATE" <= '20-03-2017' and "LANDING _OUTCOME" LIKE '%Success%'\
GROUP BY "LANDING _OUTCOME" \
ORDER BY COUNT("LANDING _OUTCOME") DESC;</pre>
```

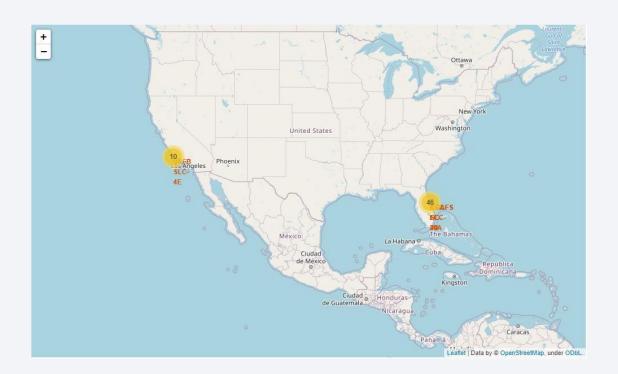

Landing _Outcome	COUNT("LANDING _OUTCOME")
Success	20
Success (drone ship)	8
Success (ground pad)	6

This query returns landing outcomes and their count where mission was successful and date is between 04/06/2010 and 20/03/2017. The GROUP BY clause groups results by landing outcome and ORDER BY COUNTDESC shows results in decreasing order.

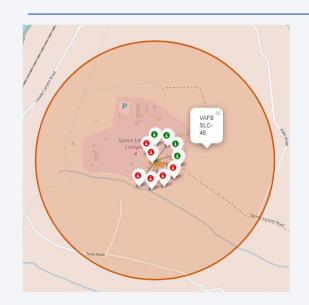

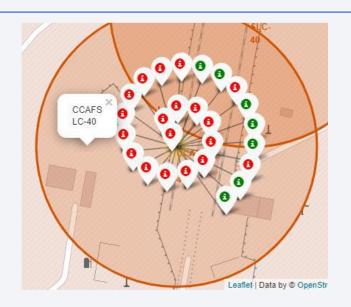

# Folium map – Ground stations

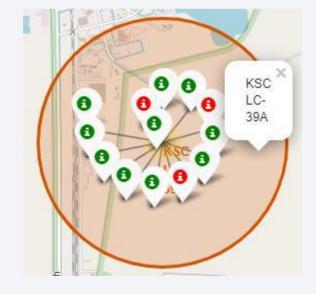

We see that Space X launch sites are located on the coast of the United States

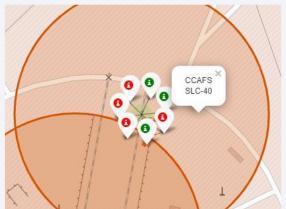

# Folium map - Color Labeled Markers

Green marker represents successful launches. Red marker represents unsuccessful launches. We note that KSC LC-39A has a higher launch success rate.

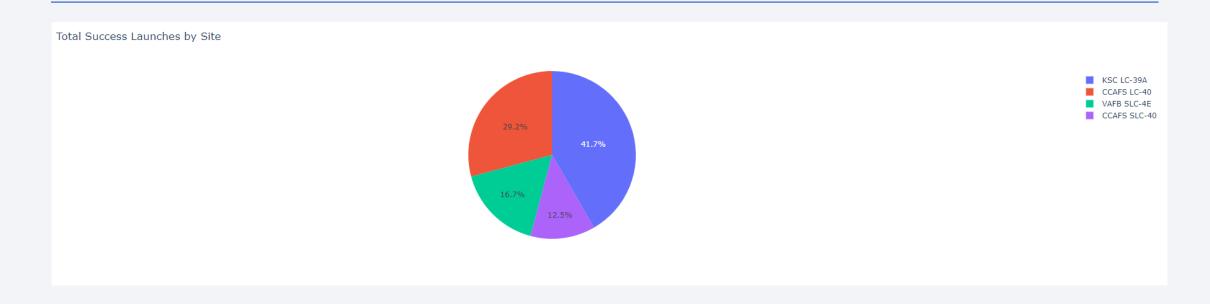

#### Folium Map –Distances between CCAFS SLC-40 and its proximities

Is CCAFS SLC-40 in close proximity to railways? Yes
Is CCAFS SLC-40in close proximity to highways? Yes
Is CCAFS SLC-40in close proximity to coastline? Yes
DoCCAFS SLC-40keeps certain distance away from cities? No

# Dashboard - Total success by Site

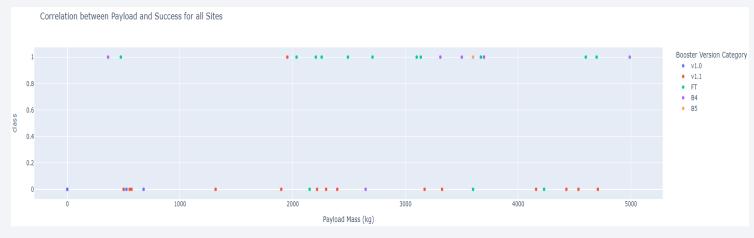

KSC LC-39A has the best success rate of launches.

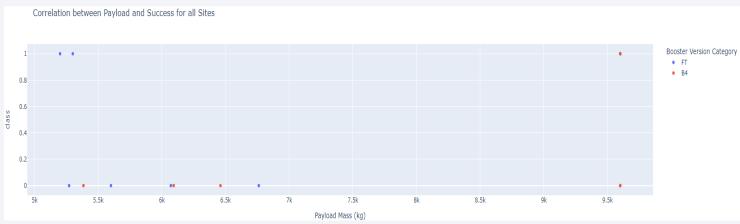

### Dashboard - Total success launches for Site KSC LC 39A

KSC LC-39A has achieved a 76.9% success rate while getting a 23.1% failure rate.

#### Dashboard - Payload mass vs Outcome for all sites with different payload mass selected

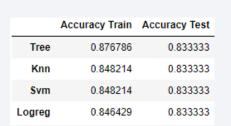

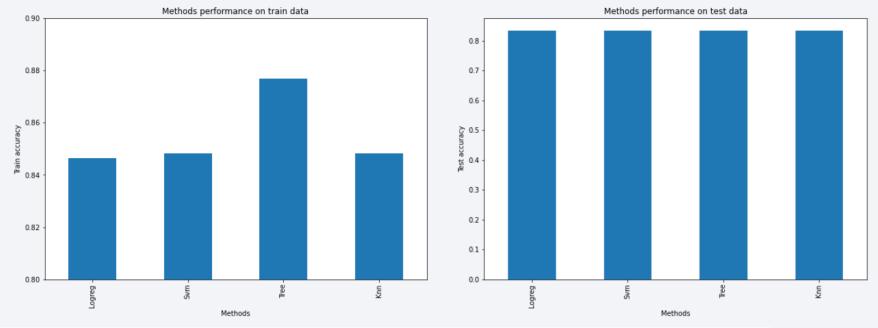

Low weighted payloads have a better success rate than the heavy weighted payloads.

# Classification Accuracy

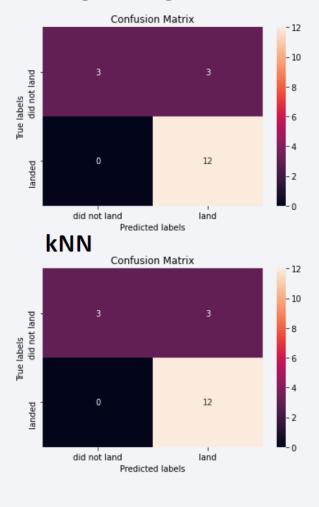

tuned hyperparameters :(best parameters) {'criterion': 'entropy', 'max\_depth': 12, 'max\_features': 'sqrt', 'min\_samples\_leaf':
4, 'min\_samples\_split': 2, 'splitter': 'random'}

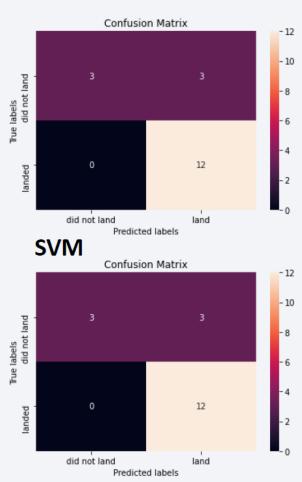

For accuracy test, all methods performed similar. We could get more test data to decide between them. But if we really need to choose one right now, we would take the decision tree.

### **Confusion Matrix**

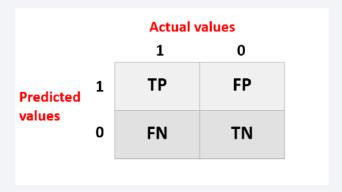

#### Logistic regression

#### **Decision Tree**

As the test accuracy are all equal, the confusion matrices are also identical. The main problem of these models are false positives.

### **Conclusions**

- The success of a mission can be explained by several factors such as the launch site, the orbit and especially the number of previous launches. Indeed, we can assume that there has been a gain in knowledge between launches that allowed to go from a launch failure to a success.
- The orbits with the best success rates areGEO, HEO, SSO, ES-L1.
- Depending on the orbits, the payload mass can be a criterion to take into account for the success of a mission. Some orbits require a light or heavy payload mass. But generally low weighted payloads perform better than the heavy weighted payloads.
- With the current data, we cannot explain why some launch sites are better than others (KSC LC-39A is the best launch site). To get an answer to this problem, we could obtain atmospheric or other relevant data.
- For this dataset, we choose the Decision Tree Algorithm as the best model even if the test accuracy between all the models used is identical. We choose Decision Tree Algorithm because it has a better train accuracy.
